

## Ingrown Nail Correction with Onyfix

Some ingrown nails can develop when the side of your toenail curls down and cuts into the skin around your nail. This can cause pain, redness and sometimes infection.

The Onyfix nail correction system works by gently bringing the curled (involved) or ingrown nail back into a natural shape.

## How does it work?

Your footcare Nurse will apply a composite material to the affected nail and shape it into a brace that holds the nail in the correct position. As the nail grows out, the brace holds the nail in the corrected position.

The Onyfix nail correction system ensures that this shape is retained as the nail grows naturally. When treatment has been completed successfully, your foot care expert removes the Onyfix nail correction system, a process that is also pain-free.
